## EXPERIMENTS IN THE EDGE TO CLOUD CONTINUUM

**Kate Keahey, Jason Anderson**

{*keahey, jasonanderson*}@uchicago.edu

*October 26th, 2021*

*theNetworkingChannel*

# SCIENTIFIC INSTRUMENTS

***What scientific instruments do Computer Scientists need?***

*Innovative and diverse hardware, breadth of deployment, freedom to touch and measure every aspect of configuration and behavior.*

***Constantly evolving!***

# CHAMELEON IN A NUTSHELL

- ▶ Chameleons like to change: a testbed that adapts itself to your experimental needs
  - ▶ **Deep reconfigurability** (bare metal) and isolation + KVM cloud (different cost/isolation trade-off)
  - ▶ Capabilities: power on/off, reboot, custom kernel, serial console access, etc.
- ▶ Balance: **large-scale** versus **diverse** hardware
  - ▶ Large-scale: ~large homogenous partition (~15,000 cores), ~6 PB of storage originally distributed over 2 sites (**UC, TACC**) connected with 100G network
  - ▶ Diverse: ARMs, Atoms, FPGAs, GPUs, Corsa switches, etc.
  - ▶ **CHI-in-a-Box** sites at Northwestern, in preparation: NCAR, IIT, and other places
- ▶ Cloud++: CHameleon Infrastructure (CHI) via mainstream cloud tech
  - ▶ Powered by **OpenStack** with bare metal reconfiguration (Ironic) + “special sauce” (50/50 split)
  - ▶ Blazar contribution recognized as official OpenStack component
- ▶ Reproducibility, repeatability, and sharing
  - ▶ **Jupyter integration** for imperative and non-transactional experiment packaging, **Chameleon daypass** for easy access, **Trovi** for sharing and finding experiments, integration with **Zenodo** for publishing

## OPEN TESTBED – BY THE NUMBERS

400+  
Papers  
published

45  
Countries

750+  
Unique  
projects

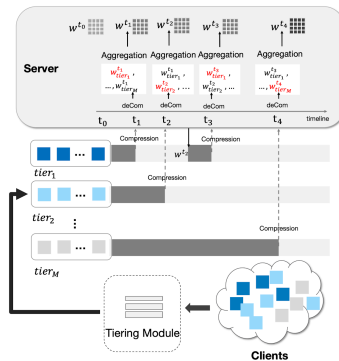

160+  
Institutions

Over  
6,000  
Users

6+  
Years Old

and 3 more  
years to grow!

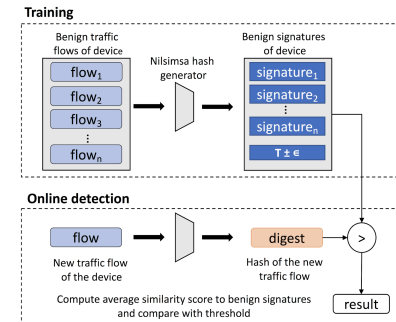

# FROM CLOUD TO EDGE WITH CHAMELEON

*federated learning*

*biometrics*

*network traffic fingerprinting for IoT devices*

- ▶ Increasingly more Chameleon project applications working on IoT/edge
  - ▶ <https://chameleoncloud.org/blog/category/user-experiments/>
- ▶ Simulation/emulation don't always provide the answer: What are the impacts of this approach on power management on edge device? How will the performance transfer to edge? Can we measure the impact of distribution/networking for edge/cloud applications?
- ▶ Goal: “realistic edge to cloud experiments from one Jupyter notebook”

# WHAT DOES AN EDGE TESTBED LOOK LIKE?

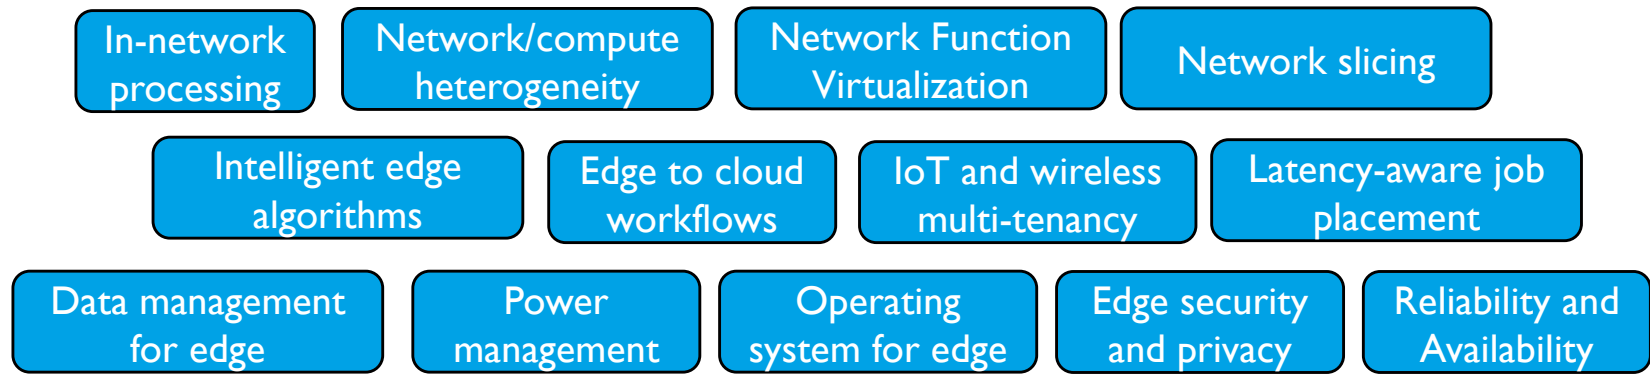

A lot like a cloud!  
All the features we know  
and love but for edge!

Not at all like a cloud!  
Location, location, location!  
Not server-class!  
IoT: cameras, actuators, SDRs!  
And many other challenges!

- ▶ CHI@Edge: all the features you know and love plus
  - ▶ **Non-prescriptive** access/reconfiguration: container deployment
  - ▶ Support for **peripherals** based on an extensible plug-in model
  - ▶ **Mixed ownership** model via an SDK with devices, virtual site, and **restricted sharing**
  - ▶ Chameleon@Edge Workshop 09/21 <https://chameleoncloud.org/chiedge-community-workshop/>
  - ▶ Edge mailing list: <https://groups.google.com/g/chameleon-edge-users>

# WHAT DOES AN EDGE TESTBED LOOK LIKE?

CHI@Edge

*chameleon-owned devices*

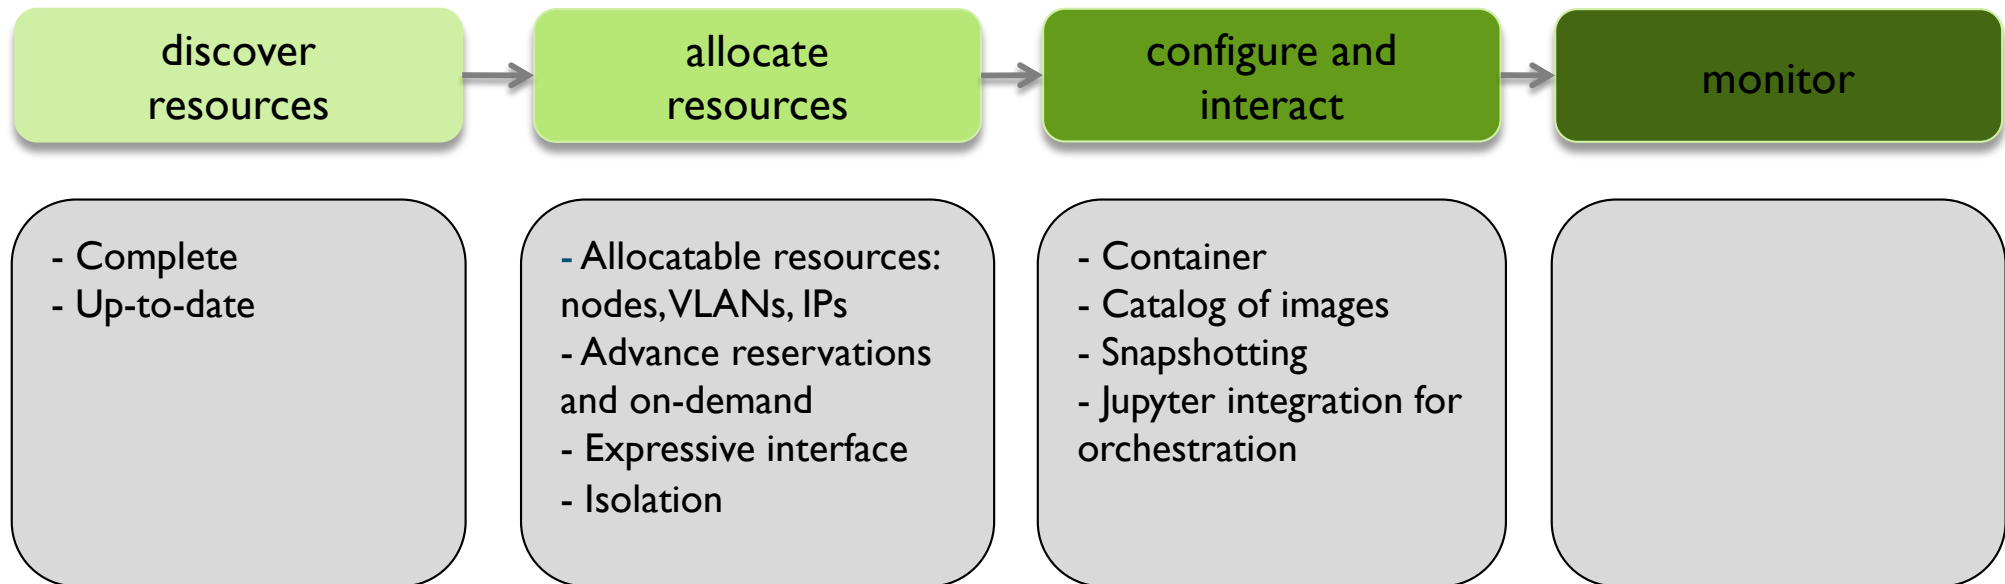

*user-owned devices*

# BUILDING CHI@EDGE

# CHI@EDGE EXPERIMENTAL WORKFLOW (PREVIEW)

*Authentication via federated identity, accessed via GUI, CLI and python/Jupyter*

# AUTONOMOUS CARS WITH CHI@EDGE

Rick Anderson  
Virtual Worlds, Director  
Rutgers University

- ▶ Goal:
  - ▶ Teach machine learning and systems concepts using remote autonomous cars
- ▶ Challenges:
  - ▶ Control the cars remotely: manual workflows require lots of teacher effort
  - ▶ Iterate on code while learning and exploring
  - ▶ Collect, store, and process large datasets
- ▶ CHI@Edge:
  - ▶ Car reservations
  - ▶ Access through JupyterHub
  - ▶ Provides consistent network connection
  - ▶ Deploy code and collect results with repeatable workflows

```
#!/usr/bin/env python
chi.use_site("CHI@Edge")
chi.set("project_name", "CHI-?????")

# Reserve a container lease
lease.add_device_reservation(reservations=[], count = 2, device_model = "4")
container_lease = lease.create_lease("lease", reservations)
lease.wait_for_active(container_lease["id"])
print(f"Lease: {container_lease['name']} is available.")

# Provision containers and append them to a hashmap
PORT = "7777"
DIR = "/var/www/html"
letter_list = [chr(ord('a')+i) for i in range(container_lease["reservations"][0]["max"])]
device_list = [container.create_container(name = f"container-{letter}",
                                         image = "id",
                                         image_driver = "glance",
                                         workdir = DIR,
                                         exposed_ports = [PORT],
                                         command = ["python3", "-m", "http.server", PORT],
                                         reservation_id = container_lease["reservations"][0]["id"])
              for letter in letter_list]

edge_device = dict(zip(letter_list, device_list))

container.execute("container-a", "python3 -c 'import this'")
```

# ARA: WIRELESS LIVING LAB FOR SMART & CONNECTED RURAL COMMUNITIES

## ▶ ARA objectives

- ▶ Enable research to achieve a factor of 10+ reduction in broadband cost and make rural broadband as affordable as urban broadband!
- ▶ Support broadband use cases for rural communities

## ▶ ARA wireless living lab

- ▶ Deploy advanced wireless platforms in Central Iowa (>600 square miles); capture systems and application and community contexts of rural broadband
- ▶ Mainstream open-source platforms for living lab management and experimentation: OpenStack, CHI-in-a-Box & CHI@Edge, ONF (SD-RAN, SD-CORE, ONOS), srsRAN, OpenAirInterface etc
- ▶ CHI@Edge: collaborating on spectrum reservations for management of wireless networks and CHI@Edge in a Box

Hongwei Zhang, ARA PI  
Iowa State University

Location and Interior view of  
ISU Beef Nutrition Research Farm

# EDGE FOR MARINE BIOLOGY

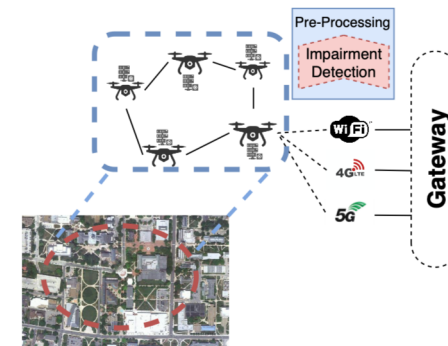

- ▶ Goal: map existing fish populations and thereby understand better how pollution impacts their habitat and the general Biscayne Bay ecosystem
- ▶ Challenges: What is the best cloud/edge strategy for collecting and analyzing data from the autonomous vehicle (AV)? How does the resolution of video data and quality of network connection influence them?
- ▶ CHI@Edge: using CHI@Edge for developing edge to cloud data processing workflows via Jupyter notebooks

Kevin Boswell, Leonardo Bobadilla,  
and Jonathan Tsen  
Florida International University

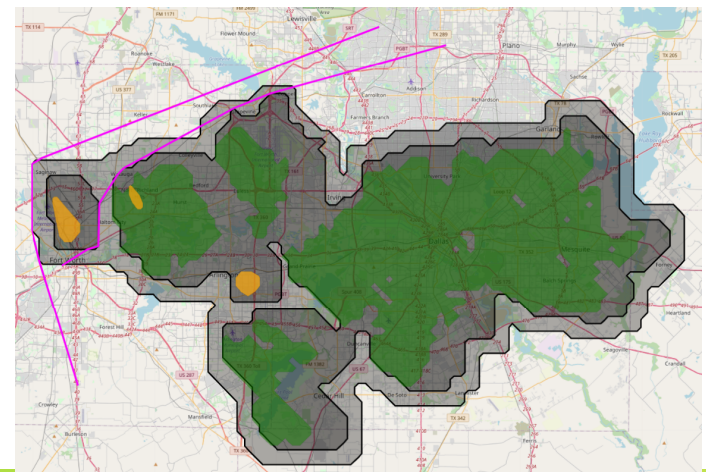

# FLYNET: AN 'ON-THE-FLY' PROGRAMMABLE END-TO-END NETWORK-CENTRIC PLATFORM

- ▶ Architecture and tools that support edge computing devices in scientific workflows
- ▶ Critical for low latency and ultra-low latency applications: e.g., drone video analytics and route planning for drones
- ▶ Challenges: integration of compute and networking infrastructure, in-network processing, end-to-end monitoring, workflow management (Pegasus)
- ▶ CHI@Edge
  - ▶ Use for edge computing experiments
  - ▶ Provide experiments that can be reproduced by other researchers
  - ▶ FlyNet to provide tools to allow researcher to include CHI@Edge in their workflows

Mike Zink FlyNet PI  
U of Mass, Amherst

# PARTING THOUGHTS

- ▶ Constantly in motion: scientific instruments are laying down the pavement as science walks on it
- ▶ **Testbed inversion**: from cloud to edge
  - ▶ Before: expensive **provider-owned** hardware as the main draw
  - ▶ Now: **user-owned** inexpensive hardware using testbed **sharing and connecting** mechanisms
  - ▶ Testbeds == effective **sharing and connecting** mechanism + residual resources
- ▶ **Heterogeneity** of resource sharing: deep reconfiguration has a cost
  - ▶ From one-size-fit-all: bare metal to KVM to containers and beyond
- ▶ Sharing research in digital form: we can no longer afford not to

*Think Big!*
